

Mathematical Foundations Practice Questions

March 6, 2017

Instructions

These are practice questions:

I PROBABILITY AND MATHEMATICAL LOGIC

- 1) Comment on the veracity of the following statements in one sentence:
 - i. A correlation coefficient of zero between two variables indicates that they are independent.
 - ii. For events A and B , $P(A \cap B) < P(A) + P(B) - 1$
 - iii. $E(XY) = E(X)E(Y)$
 - iv. To show that events A , B , and C are independent, it is sufficient to show that

$$P(A \cap B \cap C) = P(A)P(B)P(C)$$

- 2) Let A and B be two independent events with $P(A) = .4$ and $P(A \cup B) = .64$. What is $P(B)$?
- 3) If E and F are independent, are E^c and F^c independent?

II WORD PROBLEMS

- (a) 20% of people in a town usually vote for the Green Party. 30% of the people in town are unhappy with the current government. But 80% of the people who usually vote for the Green Party are unhappy with the current Government. If you know that your neighbor is not happy with the current government, what is the probability that she usually votes for the Green Party?
- (b) In a congressional election, the incumbent is a Republican (R). Three Democrats (D1, D2 and D3) are seeking the Democratic nomination. The probabilities that they win are, respectively, 0.35, 0.40 and 0.25. Furthermore, polls show that R would have a 0.40 probability of defeating D1 in the general election, 0.35 probability of defeating D2, and a 0.60 probability of defeating D3. Assuming all these estimates to be accurate, what are the chances that the incumbent retains his seat?

III DISTRIBUTIONS

- (a) Suppose that

$$f_{XY}(x, y) = \begin{cases} 6e^{-2x-3y} & \text{for } 0 < x \text{ and } 0 < y \\ 0 & \text{else} \end{cases}$$

- 1) Verify that $f_{XY}(x, y)$ is a pdf.
 - 2) Are X and Y independent?
 - 3) What is $f_{y|x}(y)$?
- (b) A pizza restaurant promises to deliver your order to the table within 10 minutes. Let Y be the time between ordering and the arrival of the pizza and suppose that the pdf of Y is:

$$f_Y(y) = \begin{cases} ky^2 & \text{for } 0 < y < 10 \\ 0 & \text{else} \end{cases}$$

- 1) Determine the value of k.
 - 2) What is $Var(Y)$?
 - 3) Find the cdf of Y and graph it.
- (c) A median is a value m such that $P(X \leq m) \geq 1/2$ and $P(X \geq m) \geq 1/2$. If X is continuous, m satisfies $\int_{-\infty}^m f(x)dx = \int_m^{\infty} f(x)dx = 1/2$. Find the median for
- i. Uniform(a, b) distribution
 - ii. Exponential(λ) distribution $f(x) = \lambda e^{-\lambda x}$.

IV CALCULATING THINGS

- 1) You receive survey data for N people which includes two pieces of information: variable X and variable Y for each individual. You calculate the following functions of the data,

$$\mu_X = 4$$

$$\mu_Y = 2$$

$$\mu_{XY} = 12$$

$$\sigma_X^2 = 8$$

$$\sigma_Y^2 = 4$$

What is the correlation between X and Y ?

- 2) An insurance company believes that people can be divided into two classes: those who are accident prone and those who are not. The statistics show that an accident-prone person will have an accident at some time with probability 0.4, whereas the probability decreases to 0.2 for a non-accident-prone person. The company also believes that 30% of the population is accident prone.
- What is the probability that a new policyholder will have an accident within a year of purchasing a policy?
 - Suppose that a new policyholder has an accident within a year of purchasing a policy: what is the probability that s/he is accident-prone?

V INFERENCE

- Some one gives you an estimated proportion of .6 supporting Trump (versus Clinton) based on a poll. He also says the variance of the estimate is .0024.
 - He forgot to tell you the sample size; what is it?
 - Comment on the plausibility of the hypothesis that Trump has same level support as Clinton in the population.
- In a simple random sample of 1,000 citizens, 560 oppose a public health care option and 440 support. Is it reasonable to assume that the country is evenly divided on this question?
- Suppose $\bar{X}$ is the sample mean of 90 observations from a population with mean μ and variance σ^2 . Find 95% confidence limits for $\bar{X}$.
 - Using Chebychev.
 - Using Central Limit Theorem.
 - Compare the two limits.
